Assignment 0423 Feedback

Britain Southwick

1b — You have successfully added to your knowledge of how operating systems manage memory. (**+**)

2d — You correctly implemented paged address translation. (**+**)

4a — Your code is functionally correct. (**+**)

4b — You generally maintained the separation of concerns provided by the given code, with the exception of the missed opportunity to use the `#defined` macros. Your code remains correct but just a little harder to adapt to other memory configurations. The addition of a Makefile is noted and appreciated though (I count this under separation of concerns because having a `Makefile` gives you more flexibility in structuring your source files while keeping the build process convenient and straightforward). (**|**)

4c — Your code is quite readable overall, though you have an occasional spacing choice with which I disagree (a case of too much near the beginning of `getPhysical`, and a case of too little near the end). (**+**)

4d — Your successful implementation shows good use of available resources. (**+**)

4e — Your commit frequency and messages are appropriate and descriptive, respectively, for the work that was done. (**+**)

4f — Submitted on time. (**+**)
